BSBF Bonding

Faster internet. Always online. Every network.

What Is BSBF Bonding?

Imagine if your internet could **combine all your connections into one powerful, unbreakable link** — your fibre, cable internet, ADSL/VDSL, satellite, 4G/5G, and even Wi-Fi working together instead of separately.

That's exactly what **BSBF Bonding** does.

BSBF Bonding takes **multiple internet lines** and merges them into one ultra-reliable, high-speed connection. So even if one line drops, your business stays connected — no interruptions, no downtime, no frustration.

Why Businesses Love BSBF Bonding

PROBLEM	BSBF BONDING SOLUTION
Unstable Internet	Combines all your internet sources (4G/5G, Fibre, Satellite, etc.) to create one stable connection
Downtime Hurts Business	If one line fails, BSBF Bonding instantly switches to another without dropping your calls or breaking your video meetings
Slow Speeds	BSBF Bonding adds the speeds of all your lines together for faster uploads, downloads, and cloud access
High Costs for Backup Lines	Instead of paying for unused backup connections, BSBF Bonding uses all connections all the time
Rural or Remote Connectivity Issues	BSBF Bonding blends multiple weaker networks into one strong, usable connection

In Simple Terms: How It Works

Think of it like a **multi-lane highway** for your internet.

Instead of sending all your traffic through one lane (one connection), **BSBF Bonding** opens several lanes — fibre, 4G/5G, and satellite — and combines them into a single, smooth road to the internet.

If one lane gets blocked, traffic automatically flows through the others. Your users won't even notice anything happened.

Network Bonding Setup #1

Six paths are bonded over MPTCP into one faster, more resilient connection.

Network Bonding Setup #2

Four paths are bonded over MPTCP into one faster, more resilient connection.

Network Bonding Setup #3

Three paths are bonded over MPTCP into one faster, more resilient connection.

Network Bonding Setup #4

Three paths are bonded over MPTCP into one faster, more resilient connection.

Benefits of Combining BSBF Bonding with a CDN as the Bonding Server

Internet acceleration along with bonding.

CDN is close to your users, applications, and sites. It optimizes all your traffic from source to destination for low latency.

Low latency by default: 330+ cities with data-centers and smart routing cut round-trip times by up to 30%.

Global resilience: Anycast and automatic failover keep you online — even through regional outages or DDoS attacks.

Anycast network

One IP worldwide: traffic auto-lands at the closest edge for consistent low latency.

Smart routing

Dynamic, congestion-aware paths shave ~30% off median response time versus standard BGP routes.

Global load Balancing & failover

Sub-second health checks with instant failover keep internet access going during incidents.

Faster Health Checks

Origin health is monitored from multiple points across the global network. These checks can spot connectivity issues from the rest of the world and fail over faster and more reliably.

Monitor and Manage Paths: BSBF Client Monitor

Live RX/TX throughput per interface, with MPTCP support detected automatically.

Set download and upload rate limit

Cap each interface independently, or leave it unlimited.

Designate interface as backup

Backup means a connection is established on the interface but data is sent only when other paths are unavailable, which is better than a failover product as the switch is instant.

Real Business Benefits

Always On, Always Connected

Even if a line fails, your operations continue seamlessly.

Faster Internet

All your connections work together to boost total speed.

Happy Teams & Customers

No more dropped Zoom calls, slow uploads, or offline payment systems.

Works Anywhere

Perfect for businesses with remote offices, rural locations, or mobile setups.

Easy to Deploy

Plug in your internet lines — BSBF Bonding does the rest. No need for special IT skills.

Who Benefits from BSBF Bonding

BUSINESS TYPE

BENEFIT

Retail & Franchise Stores

Keep card machines and online systems running 24/7

Event Organizers & Broadcasters

Seamless live streaming from multiple mobile networks

Construction & Mining Sites

Reliable internet where single providers struggle

Corporate Offices

Zero downtime between fibre and backup LTE

Schools & NGOs

Uninterrupted online learning and operations

Rural Communities

Combine several weak signals for strong connectivity

Why Choose BSBF Bonding

Open and Transparent

Built on open-source technology — no vendor lock-in, no hidden costs. Works on any Linux or OpenWrt hardware.

Proven Reliability

Already used in mining, events, and remote enterprise setups across Africa.

What Our Clients Say

"We used to lose connection daily on our site — now we're always online."

– MINING OPERATIONS MANAGER

"Streaming a 2-day conference from a farm area with no fibre was impossible before BSBF Bonding."

– EVENT PRODUCER

"Our card machines and POS systems stay online even when fibre fails."

– RETAIL CHAIN OWNER

BSBF Bonding Packages

Basic

SPEED

Up to 50 Mbps

IDEAL FOR

Home & Small Business
